LONG-LASTING ECO-FRIENDLY FIRELOG

## Maratherm Firelogs

### A longer burning firelog that's better for the environment

Maratherm premium firelogs are made from 100% recycled wood, and they're completely additive free.

These logs have incredible density and much more energy than split firewood, providing a steady glow for up to 10 hours.

- Each 2.5 lb log has 21,300 BTUs of energy, or 8,200 BTUs per pound.
- One pallet of Maratherm logs is equal to about 1-1/2 cords of dry, seasoned cordwood, but burns with less smoke.
- In woodstove tests, Maratherm logs burned for up to 10 hours, delivered consistent performance with a steady, intense heat and combusted fully without clinkers.
- Maratherm logs are ideal for wood stoves, but safe for any wood burning application, such as fireplaces, cookstoves or campfires.
- Since Maratherm logs are made from 100% recycled wood products, there is no need to harvest more trees.
- Maratherm logs also have no waxes, paraffins or glues. Since it's made from only natural wood fibre, it's also completely safe to cook over.
- These logs produce no sparks, have no pitch, no mildew, no splinters and no insects and are easy to stack and store.
- And it's good for gardens! The ash produced from Maratherm logs is a great way to enrich all types of garden soil. Just add to soil and mix thoroughly.

### How to build a long-lasting Maratherm fire:

Start a fire with kindling and smaller pieces of wood or firestarter. Once the fire is hot, add a couple of Maratherm firelogs and allow to burn at a steady heat until a hot coal bed is achieved. When the firebox holds glowing coals, add three to six Maratherm logs and turn down the combustion air control to about 1/4 open for tall chimneys, and 1/3 open for short chimneys. Close the door and allow to burn. This method will allow the longest-lasting and hottest fire without excessive heat loss through the chimney. Please be aware that live burning coals may remain within for ash for days if left undisturbed.

Store logs in a dry place.
